Moje moj short video status for youtube

Opinions of Entrepreneur contributors are their own. This is the third in a six-part series on how your business can get started on YouTube. In this installment, we explore how to edit video for YouTube.Creating a successful YouTube video involves both recording the video and editing it in a final production. The editing process, often called post-production, helps you stitch together multiple shots into a coherent, compelling whole. In recent years, post-production was an expensive process that required expensive professional equipment. Today, however, you can edit your videos on any personal computer using free or inexpensive editing software. The quality is often compared to what you find in expensive national advertisements and network news shows. Here are four steps to get you started editing your YouTube video:1. Select a video editor. You use the program to edit individual images in a single video file, which you can then upload to YouTube. The editor also lets you add text, graphics, and other special effects to your screen. Although you can buy video editors, such as Adobe Premiere Pro and Apple's Final Cut Pro, they can be expensive and complicated to use. There are a number of free or inexpensive programs that can produce satisfactory results. If you have a Windows PC, you can use Microsoft's free Movie Maker software, and if you're a Mac user, there's Apple's free iMovie. Both programs are fine for basic editing and special effects, and they are surprisingly easy to use. If you have more advanced needs, check out such programs as Adobe Premiere Elements, Sony Movie Studio Platinum and Pinnacle Studio, each of which costs \$100 or less. These programs provide more options for transitions and special effects, and provide more advanced results.2. Edit your production. Whichever editor you choose, it can be easy to put together the individual images you've made into a single video. The goal, of course, is to create a seamless video that effectively tells your story. Most editors offer a timeline view where you release each image. Each of your photos is actually a separate video file, and you add those video files to the timeline of your master video. You can move shots around, trim or shorten an individual shot, and delete the shots that don't work for you. You can then add transitions between shots, such as shots, shots, and shots. Add text, graphics, and other special effects. After you edit your individual photos together in a single video, you can enhance it with special effects. For example, most companies want to add their website URL or toll phone number to the video, which you can do by overlaying this text on the screen. With most editors, this can be achieved by adding a text layer to the video at specific points, typically the beginning and end of the video. You can also overlay images and other graphics, graphics, to display a product package while other actions occur on the screen. Other special effects include split-screen, soft focus and sepia tone. In addition, you can add background music, either your own or generic music styles provided by the editor. You don't have to be a pro to add these special effects, as most of these programs guide you through these features step-by-step. As tempting as many of these special effects can be, don't go overboard. You don't want on-screen graphics and other smart effects to take attention away from your main message. They should help tell your story, not get in the way.4. Select the correct file format. Once your video editing is complete, you can create a final video file to upload to YouTube and other video sharing sites. YouTube accepts most major file formats, so you're safe no matter which one you choose. I recommend . Avi, MP4 or . WMA formats, all supported by the major video editing programs. When editing your video, make sure you're using a 16:9 widescreen format that viewers generally expect. And no matter which file format you choose, render your file in either 720p or 1080i high definition. Even if viewers see your video in a lower-resolution format on their computer screens, you'll start with the highest possible resolution in the original file. In addition, some viewers will watch your video on large-screen HD TVs, so you won't give them a lower-resolution version. Updated: 08/31/2020 by Computer Hope Many users who have a YouTube account not only watch videos, but also upload videos. Whether your video list is too long, some of your content is out of date, or you don't want specific videos in your account, you can remove them. To delete a video from your YouTube account, follow the steps below. Note You must own the account that was used to post the video to delete the video. If you don't own the video account, you can report copyright or any of the YouTube Terms of Service if you're the copyright owner. How to delete videos from YouTube There are two ways to delete a video from YouTube. The following section shows both methods. Tip If you want to keep your video in your account but hide it from others, you can also set visibility to private or unlisted. This option lets you control who can watch the video by sharing the link or preventing it from being viewed. For help changing visibility, see: How to change the visibility of a YouTube video. Method 1 Go to the YouTube site and click in the upper-right corner (if you're not already signed in to your YouTube account). Click your profile picture in the upper-right corner of the screen. On the menu, click YouTube Studio. On the left side of the screen, click the Videos tab. Select the check box next to the video or videos you want to delete, and then click the down arrow next to More Choose Delete Forever from the menu that appears. Method 2 Finish 1-4 from the previous paragraph. Move the mouse pointer over the row that contains the video you want to delete. You should see a set of icons displayed. Click the Options icon (three vertical dots). On the menu, click Delete Forever. Additional information Opinions from Entrepreneur contributors are their own.
